Questions

5.0/5.0 points (graded)

The act of converting a level 1 DFD and creating level 2 DFD is called:

- ☐ Breakdown
- ☐ Division
- ☒ Decomposing
- ☐ Splitting
- ☐ Halving

Imagine this scenario: A payroll DFD has a Salary Data datastore. At one stage in the DFD, a process "Calculate Taxes" gets data from that data store, updates it in the process, and writes it back out. The diagram should show:

- ☐ A data flow labeled payroll details between the data store and calculate taxes process
- ☐ A dashed line labeled payroll details between the data store and calculate taxes process
- ☒ A data flow from the data store labeled, Current Payroll Details, and another dataflow from Calculate taxes to the datastore labeled Updated Payroll details
- ☐ A data flow from the data store labeled, updated Payroll Details, and another dataflow from Calculate taxes to the datastore labeled current Payroll details
- ☐ Two separate data flow, labeled Current Payroll Details, from calculate taxes process to salary data datastore.

In the context diagram, There is a process called "Start new Account". It has one output data flow "customer Data" and no input data flows. This is:

- ☐ Totally acceptable for a context diagram
- ☐ Incorrect for a context diagram, but acceptable on the Level 0 diagram
- ☐ Incorrect for both a context and Level 0 diagrams, but acceptable for a Level 1 diagram
- ☐ Incorrect for context, level 0, level 1, but acceptable for a level 2 diagram
- ☒ Incorrect in all situations

The context diagram represents -

- ☐ Detailed processing logic
- ☐ All major processes and datastore
- ☐ All the data stores in the system along with external entities
- ☒ The "big picture" of the system with external entities and only one process
- ☐ The system in context with all other systems in that department (for example, accounts payable, accounts receivable, etc.)

Which of the following is NOT true?

- ☐ Every process has at least one input data flow
- ☐ Every data flow connects to at least one process
- ☐ Every external entity has at least one input or one output data flow
- ☒ Every data flow has a unique name that is a verb phrase
- ☐ Every process has at least one output data flow

Multiple Choice

3.0/5.0 points (graded)

Scenario

A Single Sign On (SSO) is a cloud based software which centralized authentication for all the members of the organization thus enabling the members to access all the softwares provisioned by the organization using a single set of credentials. When a user tries to access a software/service, they are redirected to the SSO where they have to enter their credentials (email address and password) to authenticate themselves which is checked against a user database. Then the SSO checks if the user has permission to access the requested software/service against a permissions database. If the user has permission to access the software/service, then the user is logged into the software/service, otherwise the SSO creates a 403 error.

The component diagram for a SSO has an **"Authentication"** component and a **"User Repository"** component. What would be the relationship between these two components?

- ☐ Association
- ☐ Composition
- ☐ Aggregation
- ☐ Constraint
- ☒ Dependency
- ☐ Links
- ☐ There would be no relationship between them

The component diagram for a SSO has an **"User Repository"** component and a **"Permissions Repository"** component. What would be the relationship between these two components?

- ☐ Association
- ☒ Composition
- ☐ Aggregation
- ☐ Constraint
- ☐ Dependency
- ☐ Links
- ☐ There would be no relationship between them

The component diagram for a SSO has an **"Services Repository"** component and a **"User Repository"** component. What would be the relationship between these two components?

- ☐ Association
- ☐ Composition
- ☒ Aggregation
- ☐ Constraint
- ☐ Dependency
- ☐ Links
- ☐ There would be no relationship between them

The component diagram for a SSO has an **"Authentication"** component and a **"Services Repository"** component. What would be the relationship between these two components?

- ☒ Association
- ☐ Composition
- ☐ Aggregation
- ☐ Constraint
- ☐ Dependency
- ☐ Links
- ☐ There would be no relationship between them

The component diagram for a SSO has an **"Authentication"** component and a **"Permissions Repository"** component. What would be the relationship between these two components?

repository component. what would be the relationship between these two components?

☐ Association

☐ Composition

☐ Aggregation

☒ Constraint

☐ Dependency

☐ Links ✓

☐ There would be no relationship between them

✗

Question

5.0/5.0 points (graded)

Physical Data Flow Diagram shows ____

☐ explicit instruction on how to program pieces of code

☐ functional components needed in a program at high level

☒ implementation details of a system

☐ non-technical representation of a system

✓

Which type of cohesion ensures the order of execution but data is unlikely to be reusable?

☐ Sequential

☒ Procedural

☐ Communicational

☐ Logical

✓

Which of the following statements is false for a Structure Chart?

☐ It is not similar to a flowchart

☒ Data passing between modules is not represented in structure chart

☐ It depicts hierarchical structure of modules

☐ Each module in a structure chart represents logical piece of a program

✓

High quality of a structure chart is determined by __

☒ Reusability of Modules ✓

☐ Each module performing multiple tasks that are unrelated

☐ Control modules having more than seven subordinate modules

☒ Reasonable amount of code attached with each module

☐ Control couples being passed from high to low

✓

Which of the following components are essential for program specification?

☒ Pseudocode

☐ Data Stores

☐ Events ✓

☐ Libraries

☐ Outputs ✓

✓
