Multiple Choice

2 points possible (graded, results hidden)

Which of the following statement is true for the above diagram?

- ☐ Generalization relation between use cases and specialization relation between actors
- ☐ specialization relation between use cases and generalization relation between actors
- ☒ Generalization relation between use cases and generalization relation between actors
- ☐ Generalization relation between use cases and associative relation between actors

Submit

You have used 1 of 1 attempt

i Answer submitted.

2 points possible (graded, results hidden)

The "extend" relationship represents that:

- ☐ One use case inherits the behavior of another use case
- ☐ One use case includes the activities of another use case
- ☒ One use case conditionally provides additional functionalities to another use case
- ☐ The base use case is incomplete without the extended use case

Submit

2 points possible (graded, results hidden)

In an airport management system, a passenger can check himself in with his plane ticket. As soon as a passenger checks-in, the system generates a boarding pass for him.

Which of the following relationships can represent the relation between 'Check-In' and 'Generate Boarding Pass' in a use case diagram?

☐ Association

☒ Include Relationship

☐ Extend Relationship

☐ None of the above

Submit

Customer Relationship Management (CRM) software allows B2C businesses to maintain relationships with their customers by providing a platform on which the customer can directly communicate with a business representative or vice versa.

When a customer initiates a conversation on the CRM, the CRM will send the message to all online business representatives, send an email to a central CRM address and store the message on the CRM for future reference/analytics. How would this relationship be represented on an activity diagram?

☐ Merge Node

☐ Decision Node

☐ Join Node

☒ Fork Node

Submit

Blockchains are created using one of several consensus protocols, one such consensus protocol is proof of work. In proof of work, the following is done:

1. A transaction is requested and authenticated
 2. If the authentication fails, then the a block is not mined
 3. If the authentication succeeds, a mine request for the transaction is sent to all the nodes on the network
 4. Once a node successfully mines a nonce, it sends it to the rest of the nodes to verify the nonce
 5. If the verification succeeds, the nodes stop mining and adds the block to the blockchain
 6. If the verification fails, the nodes continue mining and the propagator of the verification request is notified
- If we create an activity diagram of the above scenario, how many merge nodes will be there?

☐ 3

☐ 4

☐ 5

☒ 2

Submit

When a business representative initiates a conversation on the CRM with a customer(s), the CRM verifies whether the given customer(s) is a registered customer with the CRM and if the customer(s) wants to be contacted. The following is a part of the activity diagram and several points are marked in red.

Point the mistakes in the activity diagram:

☐ At point "A", a JOIN node should be used

☐ At point "B", a MERGE node should be used

☐ At point "C", a FORK node should be used

☒ None of the above

Submit
