

Local Search

backtrack is a crucial factor in tree/graph.

path cost matters more
save space
fringe an extra path to extra
path a ~~2134~~ ~~1011~~ ~~1011~~ ~~1011~~
extra node visit 20.

⇒ heuristic & genetic AI related graph solve more time taken,

⇒ So AI is (not concerned with path) but
Local Search way to solve graph solve more.
extra matters more solution itself.

- Not concerned with perfect sol
- Not needed for memory usage
- perfect sol na shaksh shak
- close enough ans shaksh shak jodi back tracking shaksh necessity kam jodi,
- node shaksh info fringe 2 save kora jayashak
- memory save shaksh.

Local Search advantages:

- ① less memory
- ② less time
- ③ applicable for large size graph

Hill Climb search

might be
2D/3D/4D

blind folded manner
or (without knowing direction or
knowing upward or downward)

अज्ञान में point left on right (निर्देश-
बिना descend शुरू। सो उल्टे goal.

x_1	y_1
x_2	y_2
x_3	y_3
x_4	y_4
x_5	y_5
x_6	$y_6?$

Linear regression

point plot करी

generalize
करके देती।

x_6 against
 y_6
माता।

$$y = mx$$

$y = mx + b$
 ↗ knows
 ↗ unknown will know
 ↘ intercept
 ↘ slope

$$m \rightarrow \boxed{-\infty \leq m \leq \infty}$$

infinite search space

→ only ~~see~~ solution matters

Goal value reached (যাচাই) করে, যখন perfect fitting বা
 আদর্শ (যদি m বড় value কমালে) শাট (বাড়বে, বাড়লে)
 error বাড়বে,

- advan-
 -ত্ব
- scalable
 - path matter কখনো-
 - final value/end result নিয়ে only concerned
 - m বড় হলে state space infinite (বড়),
 অসীম memory লাগবে
 - কিছুই track রাখা নাগিয়ে simulation = just m
 বাদে।

For simplicity আমরা $y = mx$ দিয়ে,

but it intercept exist করে, $y = mx + b$

Complex problem এর ক্ষেত্রে

multiple top থাকতে পারে

unknown unknown

Depending on the
 start point,
 Sub optimal goal/top point
 return করে।

* Not known $\Rightarrow$ n dimensional.

disadvantage

sub optimal result $\leftarrow$ ① local maxima

② plateaus (stuck)

কোনো $\Rightarrow$ direction

জুড়ে-পড়ানো যাচ্ছে
কোনদিকে গেল
লক্ষ্যে

③ ridges

multiple local maxima

আসলে বহুসংখ্যক আছে

iterative approach to navigate

করা, খুব $\Rightarrow$ difficult

jump করেও approach

with no prior knowledge

large set of long lengths

Solt

Solutions:

①

→ Random start (local maxima solve হু (৩০০)

plateaus, ridges

করুন না

→ maximum iteration value set করে দে-
মাও

② problem reformulation

randomly restart in which case 42 (42),

stochastic gradient descent (SGD) is used to find the minimum of the loss function. The loss function is defined as the sum of the squared residuals of the data points. The SGD algorithm iteratively updates the parameters of the model to minimize the loss function. The process is repeated until the loss function converges to a minimum value.

① $y = x^2$

② $\sum |y_{acc} - y_{app}|$

$y = |x|$

③ simulated annealing

Initially temperature value is high,

→ high to low 200 times,

temperature value is

210 low 200 times decrease capacity

capacity 200 times decrease

and 200 times terminate 200 times

when top point 400 times (200 times)

2100 because temperature low.

Simulated annealing

$$C = C_{init}$$

$$T = T_{max} \text{ to } T_{min}$$

$$E_C = E(C) \neq$$

$$N = \text{Next}(C)$$

$$E_N = E(N)$$

$$\Delta E = E_N - E_C$$

$$\text{if } (\Delta E > 0)$$

$$C = N$$

$$\text{Else if } (e^{\Delta E/T} > \text{rand}(0,1)) \text{ // } \Delta E = -1, T_{max} = 100, T_{min} = 2$$

$$C = N$$

END

[T control the temperature]

[$E_C \rightarrow$ Energy i.e. utility
on goodness value
of state C]

[N $\rightarrow$ Next state of
current
state C]

[$E_N \rightarrow$ Energy i.e. utility
of state N]

$$\text{// } e^{\Delta E/T} = 0.99 \text{ for } T_{max}$$

$$\text{// } e^{\Delta E/T} = 0.68 \text{ for } T_{min}$$
