

Ans. to the q. no. - 01

A) Agile would be the ideal development method to work according to the above scenario.

As the CEO informed that he might bring changes in the middle of the development, this means that taking feedback and hearing from the client in the middle of the work is necessary and important. Agile always put emphasis on customer collaboration. In this method, customer's feedback and bringing changing or coming with a new idea is always welcomed.

①
B) From my chosen development method means Agile, progress can be check so frequently. Agile offers Burndown chart to keep eye on progress.

By looking on Burndown Chart, team lead can clear about the completed tasks, as well as remaining tasks which helps to understand about how more effort should ~~prove~~ provide or is the the work flow is going smoothly.

②

c) As documentation is recommended for using further, there can be use the combination of Agile and Waterfall methodologies. This would help to develop in a flow and allocating time for comprehensive documentation which could help to provide longevity of the product.

D)

Functional requirements:-

1. Sending text message and voice clips.
2. Sending images and file attachments.
3. Real-time collaboration.
- 4.

Non-functional requirements:

1. High responsiveness
2. Data security and user privacy
3. Ability to process large amount of data.
4. ~~User~~ User friendly.

Ans. to the q. no.-03

A) Entity-Component system software pattern could be use to handle large number of simultaneous players, also real-time gameplay.

The major advantages of this pattern is it is highly suitable for controlling gaming run and real time behavior.

But the problem is that it's hard to get understanding about this pattern in the first time.

B) one disadvantage of using a Monolithic software architecture is it is not that much capable to process with big amount of user at a time and in real time.
